

Claims:

1. (Previously Presented) A method for sending electronic mail from a client operating within a client-server architecture, the method comprising:
 - (a) provisioning the client with client non-email broadcast text messaging software;
 - (b) provisioning a server with server non-email broadcast text messaging software, wherein the server is in communication with the client;
 - (c) broadcasting from the client a text message in a format of the non-email broadcast text messaging software using subject based addressing wherein text in a subject field of the text message indicates to which client the message is intended, and wherein the text message contains the electronic mail;
 - (d) receiving the text message at the server;
 - (e) reformatting the text message from the format of the non-email broadcast text messaging software to a format compatible with an email server; and
 - (f) forwarding the reformatted text message to the email server; wherein broadcasting includes transmitting a text message from a single network component to all components on a network.

2. (Previously Presented) The method of claim 1, wherein broadcasting the text message comprises multicasting the text message to a group of network components in communication with the client, and wherein the server is in the group of network components in communication with the client.

3. (Previously Presented) The method of claim 1, wherein broadcasting the text message containing the electronic mail comprises:

- (i) identifying a triggering event that precipitates a need for the electronic mail;
- (ii) determining an email body, an email subject, and an email address for the electronic mail, wherein the email body, the email subject, and the email address correspond to the triggering event; and
- (iii) instructing the client non-email broadcast text messaging software to broadcast the text message containing the electronic mail, wherein the electronic mail contains the email body, the email subject, and the email address.

4. (Original) The method of claim 3, wherein the client monitors data traffic in a digital wireless packet switching network and the triggering event is an overload on network capacity that requires a change in traffic routing.
5. (Original) The method of claim 3, wherein the client monitors hard disk space on other clients, and the triggering event is a shortage of hard disk space.
6. (Original) The method of claim 3, wherein determining the email body, the email subject, and the email address comprises consulting a database cross-referencing triggering events with email bodies, email subjects, and email addresses.
7. (Previously Presented) The method of claim 3, wherein determining the email body, the email subject, and the email address comprises a user manually entering the email body, the email subject, and the email address into a test program of the client non-email broadcast text messaging software.
8. (Previously Presented) The method of claim 3, further comprising forwarding the electronic mail from the email server through a network to the email address.

9. (Previously Presented) The method of claim 1, wherein broadcasting the text message containing the electronic mail comprises:

- (i) determining an email body, an email subject, and an email address using data processing software;
- (ii) accessing an application program interface of the data processing software;
- (iii) sending the email body, the email subject, and the email address to the application program interface; and
- (iv) accessing the client non-email broadcast text messaging software with the application program interface and instructing the client non-email broadcast text messaging software to broadcast the text message, wherein the text message contains the email body, the email subject, and the email address.

10. (Previously Presented) The method of claim 1, further comprising forwarding the electronic mail from the email server through a network to an email address.

11. (Original) The method of claim 10, wherein the email address is an email address of a wireless pager.

12. (Previously Presented) The method claim 1, wherein the message includes a subject in accordance with subject-based addressing of the client non-email broadcast text messaging software and the server broadcast text messaging server, and wherein the server is configured to recognize the subject and read the text message.

13. (Original) The method of claim 1, wherein the format compatible with the email server is Messaging Application Program Interface (MAPI).

14. (Previously Presented) The method of claim 1, wherein the client non-email broadcast text messaging software is different from, but compatible with, the server non-email broadcast text messaging software.

15. (Previously Presented) The method of claim 1, wherein the client non-email broadcast text messaging software and the server non-email broadcast text messaging software are TIB Rendezvous™.

16. (Previously Presented) A system for sending an electronic mail from a client in a client-server architecture, the system comprising:

- (a) a plurality of clients, wherein each client of the plurality of clients contains client non-email broadcast text messaging software, data processing software, and a client application program interface, and wherein each client is in communication with the plurality of clients;
- (b) a non-email text messaging server in communication with the plurality of clients, wherein the non-email text messaging server contains server non-email broadcast text messaging software and an email application program interface, wherein the email application program interface is adapted to receive a text message using subject based addressing wherein text in a subject field of the text message indicates to which client the message is intended, and containing the electronic mail and reformat the text message from a format compatible with the server non-email broadcast text messaging software to a format compatible with an email server; and
- (c) an email server in communication with the text messaging server;

wherein the broadcast text messaging software is configured to transmit a text message from a single network component to all components on a network.

17. (Original) The system of claim 16, wherein the data processing software monitors for a triggering event requiring email and determines an email body, an email subject, and an email address for the electronic mail, wherein the email body, the email subject, and the email address correspond to the triggering event.

18. (Previously Presented) The system of claim 16, wherein the data processing software is a testing program of the client non-email text messaging software through which a user can enter an email body, an email subject, and an email address for the electronic mail.

19. (Previously Presented) The system of claim 16, wherein the client application program interface is adapted to instruct the client non-email broadcast text messaging software to send a text message containing the electronic mail to the text messaging server.

20. (Original) The system of claim 16, wherein the client application program interface is one of a dynamic link library, a control, and an object module.

21. (Canceled).
22. (Original) The system of claim 16, wherein the email application program interface is one of a dynamic link library, a control, and an object module.
23. (Previously Presented) The system of claim 16, wherein the client non-email broadcast text messaging software enables broadcasts and multicasts from the plurality of clients.
24. (Previously Presented) The system of claim 16, wherein the client non-email broadcast text messaging software is different from, but compatible with, the server non-email broadcast text messaging software.
25. (Previously Presented) The system of claim 16, wherein the client non-email broadcast text messaging software is the same as the server non-email broadcast text messaging software.
26. (Previously Presented) The system of claim 16, wherein the client non-email broadcast text messaging software and the server non-email broadcast text messaging server are TIB Rendezvous.

27. (Original) The system of claim 16, wherein the email server is adapted to receive the electronic mail and forward the electronic mail through a network.

28. (Previously Presented) The system of claim 16, wherein the server non-email broadcast text messaging software and the email application program interface are a single Transaction Control Protocol / Internet Protocol program.

29. (Previously Presented) A method for sending an electronic mail comprising:

- (a) broadcasting from a client computer a text message in a broadcast format using subject based addressing wherein text in a subject field of the text message indicates to which client the message is intended, and wherein the text message contains the electronic email, wherein the client computer is part of a client-server architecture, and wherein the client computer does not have electronic mail software;
 - (b) receiving the text message at a server computer of the client-server architecture;
 - (c) reformatting the text message from the broadcast format to an email format; and
 - (d) forwarding the reformatted text message to an email server that is compatible with the email format;
- wherein broadcasting includes transmitting a text message from a single component on a network.

30. (Previously Presented) The method of claim 29, wherein the client computer uses TIB Rendezvous™ software to broadcast the text message containing the electronic mail, and wherein the server computer uses TIB Rendezvous™ software to receive the message.

31. (Previously Presented) The method of claim 29, wherein the client computer uses Transaction Control Protocol / Internet Protocol software to broadcast the text message containing the electronic mail, and wherein the server computer uses Transaction Control Protocol / Internet Protocol software to receive the text message.

32. (Previously Presented) The method of claim 29, further comprising forwarding the electronic mail from the email server through a network to an email address specified in the electronic mail.

33. (Original) The method of claim 29, wherein the broadcast format is a TIB Rendezvous™ format and the email format is a Messaging Application Program Interface (MAPI) format.

34. (Previously Presented) A system for sending an electronic mail from a client in a client-server architecture, the system comprising:

- (a) means for broadcasting from a client computer a text message in a non-email broadcast format using subject based addressing wherein text in a subject field of the text message indicates to which client the message is intended, and wherein the text message contains the electronic email, wherein the client computer is part of a client-server architecture;
- (b) means for receiving the text message at a server computer of the client-server architecture;
- (c) means for reformatting the text message from the non-email broadcast format to an email format; and
- (d) means for forwarding the reformatted text message to an email server that is compatible with the email format; wherein broadcasting includes transmitting a text message from a single network component to all components on a network.

35. (Previously Presented) The system of claim 34, wherein the non-email broadcast format is a TIB Rendezvous™ format and the email format is a Messaging Application Program Interface (MAPI) format.
